Identify the Problem

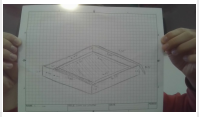

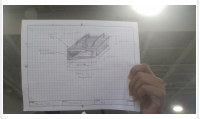

Who? Citizens who require effective food transportation. What? They cannot receive nutritious foods due to poor transportation and temperature regulation systems. When? During food shortages, especially during natural disasters. Where? In places that are affected due to natural disasters or other causes. Why? Because they are not receiving the necessary amount of nutrients and foods for the body. Problem Statement: During natural disasters, food shortages commonly occur which puts thousands of citizens at risk of malnutrition and other dangerous effects due to the lack of food and poor food transportation.

Problem Understanding

1.	Oct 20, 2026	Food temperatures should be regulated so citizens can enjoy meals in a safe temperature range. (JL)	Client Statement
2.	Oct 20, 2026	The container should measure 6.75" in width x 9.50" in length x 2.0" in height. (JR)	Client Statement
3.	Oct 20, 2026	The container should have internal space for MicroBits to regulate temperature for heating and cooling components. (NK)	Client Statement
4.	Oct 20, 2026	The container should not be at risk of food spilling and be easy to carry and open, especially for the region of the delivery. (NK)	Client Statement
5.	Oct 20, 2026	The macronutrient ratio should be 60% Carbohydrates, 30% Proteins, and 10% Fats. (JL)	Client Statement
6.	Oct 20, 2026	The meals should provide care for at least 2 researched medical conditions. (JR)	Client Statement

Ideate

Concept A "Jayden Lee"		The EatEZ delivery box is designed so a MicroBit heating system is able to be attached. The box is designed to have 8.75 inches in width and 9.50 inches in length so there is space for a regular lunch box to easily fit into the box and a space where a MicroBit heating system can be implemented to regulate temperature. The buttons of the MicroBit will be out on the front left of the box while the main body of the MicroBit will be on the inside of the box while the heating pads will be under the foil that is on the floor of the box. Finally, there is a latch on the front of the box where a rubber band will be stretched out to hook onto a part of the box so there is no risk of food spills and leaks.
Concept B "Juan Ramos"		This modification of the Car-Pack establishes smart cooling and heating elements that help maintain food at the desired temperature, keeping hot items warm and cold items cool during transportation. It also includes high-quality insulation to reduce temperature loss, prevent spills, and protect food from spoilage. The container is designed with practical dimensions of 8.75 inches in width and 9.5 inches in length, making it compact enough to fit comfortably in a vehicle while still providing sufficient space for food storage. This combination of temperature control, insulation, and convenient sizing improves food safety, preserves quality, and enhances the overall user experience.
Concept C "Nivedh Koloth"		My prototype, the EatEZ PRO, can manage your meals with the help of a small but powerful Micro bit. The EatEZ PRO is designed to keep food warm during transportation by using heating pads controlled by the Micro bit. The box measures 8.75 inches wide and 9.50 inches long, providing enough space for a regular lunch container while leaving room for the heating system. The Micro bit buttons are placed on the outside for easy temperature control, while the main board is safely stored inside the box. A secure latch and rubber band keep the lid closed to help prevent spills and leaks. This design combines convenience, temperature regulation, and food safety in one portable container.

Temperature Regulation and MicroBit Compartment Space Prototype EatEZ PRO x Ferrari Concept C "Nivedh Koloth"

Oct 28, 2026

REQUIREMENT	TEST NAME	RESULT
The container should have internal space for MicroBits to regulate temperature for heating and cooling components. (NK)	Temperature Regulation and MicroBit Compartment Space	5/5

Type: Boolean

Steps

1. Distribute 10 EatEZ PRO x Ferrari lunchboxes to 10 people. (NK)
2. Put the MicroBit and circuit inside of the compartment space next to the area for the lunch box. (JL)
3. Put the fan, LED, and MicroBit inside of their desired sockets to make sure everything correctly fits. (NK)
4. Turn the battery connected to the MicroBit on. (JR)
5. Check if the LED turns on and if the fan turns on while the LED is on as well once on and off buttons are pressed. (JL)

TRIALS	RESULTS
1	Pass
2	Pass
3	Pass
4	Pass
5	Pass

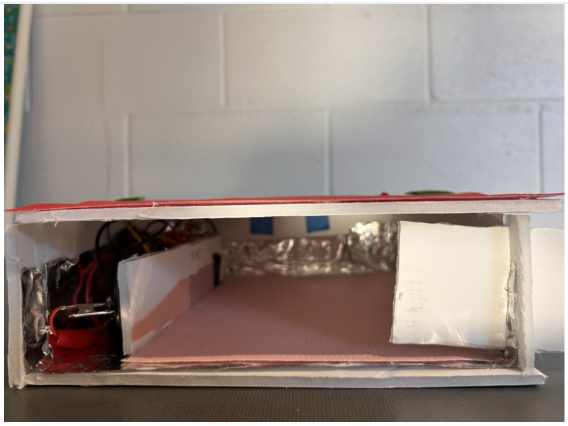

Turned out successfully on every step.

Research Notes

Oct 30, 2026 4:03PM - Nivedh Koloth Shijan

What is your Biological Inspiration and how is it incorporated into your design? For the EatEZ design, the biological inspiration is the slender-tailed meerkat, whose natural adaptations for temperature control basking in the sun are directly incorporated into the thermal regulation system. The leather exterior and lining represent the meerkat's dense fur coat, providing robust external insulation to lock in warmth and prevent temperature loss. Meanwhile, the aluminum foil interior walls mirror the meerkat's dark belly skin and vascular network used during basking, helping to rapidly absorb, reflect, and evenly distribute heat throughout the enclosure. This bio-inspired insulation works in tandem with the internal cooling fan and MicroBit system to maintain a safe, precisely regulated environment for food storage. (NK)

Nov 1, 2026 1:18PM - Jayden Lee

How does your design incorporate thermal regulation? Our design incorporates thermal regulation through the cooling fan system attached onto the inside of the lunchbox where it can be turned on and off. When regulating warmer temperatures, the lunchbox uses aluminum foil and leather to insulate heat throughout the box as the foil is fully covered over the walls constantly reflecting heat and staying insulated from the leather. Our biological inspiration from the Slender Tailed Meerkat also incorporates thermal regulation through the leather in the lunchbox which represents the insulating coat, and the aluminum foil which represents the circulation of heat in the Meerkat's body which helps heat spread throughout the lunchbox. (JL)

Nov 1, 2026 1:36PM - Juan Ramos

Our design uses elements from our current lunch boxes such as, reflective inside coating, High double layer insulation, heating elements, and handles for easy carry, it is also very big in order to fit the bento box. It is also covered in leather in order to further improve insulation. The foam material that the majority of the box also works to insulate the inside from the outside.(JR)
